INTRODUCTION

In today's educational environment, student feedback mechanisms are critical for improving higher education quality. These systems, especially those that record students' complaints and goals, guarantee that educational institutions continue to adapt to the changing requirements and concerns of their student populations. Efficient feedback systems enable smooth communication between administrators and students, supporting ongoing enhancements to institutional processes and educational services.

Despite the fact that schools have established methods for contact, like verbal reporting, many student issues frequently fail to be thoroughly reported, monitored, or promptly resolved. Conventional approaches lack transparency, which makes it challenging for administrators to effectively handle and address problems and for students to know the status of their reports. Centralized digital systems that enable real-time submission, monitoring, and feedback are also not widely used. This gap emphasizes the necessity of an online platform that can guarantee

accountability in the educational setting, enhance communication, and expedite the reporting process.

The purpose of this study is to develop a Web-Based School Concern and Feedback Reporting System that provides a chance for students to voice their concerns with or without knowing their identity, share feedback, and promote accountability within the school. Students can access a summary of all complaint data on the interface, including the type of complaint, date, and time of the complaint. All complaints are also fully accessible to the administrator. Our system involves submission and recording all the concerns of the students, evaluation of the reported issues, and the effective response and resolution by school administrators.

BODY

Complaint Management Systems

According to Anusiuba et al. (2021), some concerns in the academic setting must be appropriately handled in order to have an effective educational system. The university's complaints management system is one example. In the past, this difficulty has made it difficult for students to advance academically in many areas of the educational system. To support this approach, this study offers a number of options for managing and resolving academic complaints. This includes the mandate that an administrator make every effort to resolve potential or real academic issues as quickly as possible in the first place. One must listen, understand, offer a solution, implement it, and then follow up to address complaints.

Web-Based Information System

Anusiuba (2023) stated that the goal of a web-based system for managing student complaints is to enhance the way that educational institutions address student issues. While assisting administrators in identifying problems, enhancing communication standards, and improving services, it offers an organized and easily accessible forum for students to file concerns.

Through automation and well-defined protocols, the system also seeks to improve the efficiency, timeliness, and fairness of the complaint processing process. In general, it encourages greater openness, quicker settlement of academic issues, and a more productive learning environment.

System Usability and User Experience

The success of web-based student feedback systems is greatly influenced by system usability and user experience. Research indicates that students' interactions with these platforms are greatly influenced by their accessibility and usability. Students can file complaints at any time and from any location using web-based systems that are accessible on a variety of platforms, such as desktops, tablets, and mobile phones. This enhances overall engagement and usability. Furthermore, removing conventional obstacles like in-person reporting and paper-based procedures improves user comfort and motivates more students to use feedback systems

(Oghenekaro & Ibitomisin, 2020; Okokpujie et al., 2021). Additionally, by enabling students to track the progress of their concerns, features like real-time tracking and quicker response times increase customer happiness. This degree of accessibility improves the user experience overall and fosters trust. Additionally, studies show that responsive, user-friendly, and timely feedback-capable systems foster better interactions between administrators and students, which in turn boosts system efficacy and satisfaction (Mohammed et al., 2022).

RELATED STUDIES

Online complaint management systems facilitate quicker and easier reporting, which enhances service delivery in educational institutions. According to Ali et al. (2024), traditional complaint systems frequently experience problems, including low user awareness and scarce resources, which diminish their efficacy. Their study developed an online system with capabilities like text-to-speech, speech-to-text, and complaint history tracking, enabling simpler filing and tracking in order to address this. All things considered, the approach improves accessibility, lowers user effort, and aids organizations in better analyzing and handling concerns.

The study from HSPublishing (2024) focuses on complaint management systems and how they might enhance service delivery, organizational efficiency, and transparency. It clarifies that addressing complaints properly enables organizations to improve consumer satisfaction and handle problems in a methodical manner. But the study also points out problems like ineffective execution, scarce resources, and delays. These results emphasize how crucial it is to create a web-based school complaint system that enables kids to submit issues more quickly, efficiently, and easily.

The design and implementation of a student who studies online complaint management system for higher education institutions is the main subject of the study by Uwah and Etim (2024). It illustrates how manual complaint procedures frequently result in data loss, delays, and inadequate suggestions, all of which have an impact on student happiness. By enabling students to file grievances online, monitor their progress, and get immediate feedback, the suggested web-based method increases productivity. This demonstrates the necessity of a digital complaint system in schools to enhance organization, accessibility, and student-administrator communication.

The introduction of a web-based system intended to measure and monitor student engagement in educational institutions is covered in the PMC (2020) research. It clarifies that conventional approaches to monitoring student involvement and concerns are frequently ineffective and do not gather data in real-time. The suggested approach uses digital monitoring tools to enhance institutional decision-making, communication, and data accuracy. The creation of an online school concern and feedback system that improves productivity, openness, and student involvement is supported by these findings.

The creation of a web-based feedback system intended to assess academic staff performance in higher education institutions is covered in IJERT (2020). It clarifies that conventional feedback techniques are frequently sluggish, ineffective, and prone to mistakes in the gathering and processing of data. By enabling students to provide feedback online in a more structured and convenient manner, the suggested system enhances the evaluation process. These results encourage the creation of web-based feedback systems that improve the effectiveness, precision, and caliber of instruction in classrooms.

SYNTHESIS OF LITERATURE

Web-based complaint and feedback systems are crucial for enhancing communication and service delivery in educational institutions, according to the examined literature and relevant studies. According to the majority of research, these systems give students an organized and convenient way to voice their issues, which leads to quicker response times and more effective complaint handling. Additionally, the use of web-based technologies improves organization, accessibility, and transparency, facilitating better communication between administrators and students.

Nevertheless, a number of drawbacks were found in the current systems, including slow reaction times, a lack of real-time tracking, and a lack of features that are easy to use. Some educational institutions continue to use manual or traditional techniques, which can result in data loss, inefficiencies, and challenges in tracking and addressing student issues. These problems make complaint management systems less effective and lower customer satisfaction.

To fill in these gaps, a web-based school concern and feedback reporting system must be developed. The goal of the suggested system is to offer a more effective, approachable, and user-friendly platform that enhances student-administrator communication, guarantees prompt responses, and encourages accessibility in addressing issues.

CONCLUSION

Web-based complaint and feedback systems are crucial for enhancing communication, productivity, and service delivery in educational institutions, according to the studied literature. These tools give students a convenient way to voice their concerns and facilitate more efficient responses from officials. The studies also emphasize how crucial usability and user experience—such as accessibility, simplicity of use, and real-time tracking—are to raising user satisfaction. Nevertheless, there are still issues, including tedious processes, a lack of user-friendly features, and delays. In order to provide a more effective, dependable, and accessible method of handling student issues, the results generally support the necessity for a web-based school problem and feedback reporting system.
